

Offer Dropbox-like encrypted storage to your clients

With help of ene, your clients can store and share their files in cloud storage. They can do that with the extra protection layer that comes from data encryption. The system was designed to protect files with your unique encryption key with the best sharing options possible.

Drag & Drop

Your client can simply drag and drop the files on a web-browser screen into a folder of their choice. The system will do the rest

Sharing

Your client can invite other people to the system like employees, partners or even clients and let them store their files

Versioning

The system protects files from being overwrite. The history of the files will stay in the system as long as your client wants.

Access control

Your clients can use an access control system to allow people to download only selected files. Your client can track who downloaded the file and from where

MFA protection

Access to the system can be protected by a multi-factor authentication system, disallowing access to the files by unauthorized personnel

On your own server

The system can work from any cloud-based infrastructure or it can be placed in the company/enterprise location
